

Dingding Ren

The global death bird crisis is a concerning issue that requires immediate attention and action. As campuses grow and urbanize, birds' natural habitats diminish, resulting in a decline in bird populations due to a loss of nesting and foraging habitats. In addition, the use of pesticides and herbicides on campuses can have a negative impact on the health of birds and disrupt the delicate balance of their ecosystems. The resultant lack of suitable habitats and exposure to toxic chemicals further contribute to the decline in the diversity and abundance of birds on campuses. It is imperative that educational institutions prioritize conservation efforts, construct bird-friendly spaces, and educate the public on the significance of preserving bird habitats.
