

The HRRC is an interdisciplinary research center seeking to understand the nature and impact of natural and technological hazards upon humans and the physical and built environment in which they live. The HRRC has many educational and research opportunities for students, such as the Hazards Research Leadership Program, HazDis student organization, and other professional opportunities as they arise. For research, we conduct convergent research that integrates numerous academic disciplines while engaging with community partners on priority hazard and disaster challenges. As a leader in the field, the Center's unique expertise is at the intersection of hazard risk and resilience within the built and social environments.
